

Dihybrid Crosses: Crosses that involve 2 traits.

These type of crosses can be challenging to set up, and the square you create will be 4x4. This simple guide will walk you through the steps of solving a typical dihybrid cross common in genetics. The method can also work for any cross that involve two traits.

*Consider this cross :

A pea plant that is heterozygous for round, yellow seeds is self fertilized, what are the phenotypic ratios of the resulting offspring?

- **Step 1: Determine the parental genotypes from the text above, the word "heterozygous" is the most important clue, and you would also need to understand that self fertilized means you just cross it with itself.**

$$RrYy \times RrYy$$

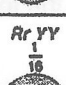

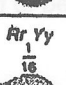

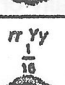

- **Step 2: Determine the gametes.** This might feel a little like the FOIL method you learned in math class. Combine the R's and Y's of each parent to represent sperm and egg. Do this for both parents

Gametes after "FOIL"

RY, Ry, rY, ry (parent 1) and RY, Ry, rY, ry (parent 2)

- **Step 3: Set up a large 4x4 Punnet square, place one gamete set from the parent on the top, and the other on the side**

		♂ gametes			
		RY 1/4	Ry 1/4	rY 1/4	ry 1/4
♀ gametes	RY 1/4	RRYY 1/16 	RrYy 1/16 	RrYy 1/16 	RrYY 1/16 
	Ry 1/4	RRYy 1/16 	Rryy 1/16 	Rryy 1/16 	RrYy 1/16 
	rY 1/4	RrYy 1/16 	Rryy 1/16 	rryy 1/16 	rrYy 1/16 
	ry 1/4	RrYy 1/16 	RrYy 1/16 	rrYy 1/16 	rrYY 1/16 

9 : 3 : 3 : 1

 Round, yellow

 Wrinkled, yellow

 Round, green

 Wrinkled, green

Step 4: Write the genotypes of the offspring in each box and determine how many of each phenotype you have. In this case, you will have 9 round, yellow; 3 round, green; 3 wrinkled, yellow; and 1 wrinkled green

Some Shortcuts

In any case where the parents are heterozygous for both traits (AaBb x AaBb) you will always get a 9:3:3:1 ratio.

9 is the number for the two dominant traits, 3 is the number for a dominant/recessive combination, and only 1 individual will display both recessive traits.

Another way to determine the ratios is to do it mathematically

- 3/4 of all the offspring will have round seeds
- 3/4 of all the offspring will have yellow seeds

$3/4 \times 3/4 = 9/16$ will have round, yellow seeds.

Crosses that Involve 2 Traits

Consider: R r Y y x r r y y

The square is set up as shown

	RY	Ry	rY	ry
ry	RrYy round, yellow	Rryy round, green	rrYy wrinkled, yellow	rryy wrinkled, green
ry	RrYy	Rryy	rrYy	rryy
ry	RrYy	Rryy	rrYy	rryy
ry	RrYy	Rryy	rrYy	rryy

1/4 round, yellow
1/4 round, green
1/4 wrinkled, yellow
1/4 wrinkled, green

You might notice that all four rows have the same genotype. In this case, you really only need to fill out the top row, because 1/4 is the same thing as 4/16
